GlovePIE is a lightweight tool that can emulate a vast array of input devices, from the standard mouse and keyboard to MIDI devices, Wiimotes and Virtual Reality gloves. Permits you to create macro buttons for complex keystrokes Following a straightforward setup that entails decompressing the archive in any desired location, you come face to face with an UI that can remind you of a code editor. The idea behind the tool is to allow you to create scripts for emulating input devices, but you can also employ it to create macro buttons for more complex actions. Even though the app includes a Help section and even a tutorial, it mostly addresses advanced users who know how to write scripts. It is necessary to mention that the app solely works with PIE files so you can either work with the samples provided or create other ones from scratch. Enables you to access keyboard-only apps and joystick-only games The highlight of the application is that it allows you to overcome the limits imposed by certain software solutions or games that can be accessed and respectively played with one type of controller. Consequentially, the program can be employed with WorldViz PPT Trackers, eMagin Z800 3D Visor HMD, Nintendo Wii Remote, Sony Dual Shock as well as all mice, keyboards, joysticks and gamepads recognized by Windows. As suggested by the name, the app also works with various types of Virtual Reality gloves, such as all versions of 5DT Data Glove and the Essential Reality P5 Glove. The most sensible interpretation of the tweet seems to be that Tesla has developed a breakthrough in battery technology that will provide a substantial improvement to the model S. We've seen several mentions of "thorium" in Tesla tweets in the past, but never before has it seemed that the company had such a novel and non-traditional battery system in the works. Now, battery technology is one of the most difficult things to work on. Supercapacitors are just as difficult, but Tesla has had some success with that. The company's new approach to batteries is likely derived from the science fiction of the future that is the new movie called The Power of One. In the movie, Tesla/SpaceX founder Elon Musk plays a genius who has a massive breakthrough in battery technology. We're sure Tesla is quite
