Disable and optimize Windows features It's possible to disable auto reboot on system crash to continue with work, as long as the issue doesn't affect Windows. Furthermore, you can deactivate remote access to the Windows registry to protect it, along with Task Scheduler, Windows Defender and UAC. These last four options require system restart. As far as optimization options are concerned, you can increase the shutdown and restart speed of applications and services by modifying the timeout values, speed up the low-level hooks timeout and application hung timeout when it's no longer responding to commands, as well as remove delay from opening menus to boost navigation. Evaluation and conclusion The tool worked smoothly in our tests, without triggering the OS to hang, crash or prompt error messages.
